

Technology Mechanism to keep track of changes made to File(s)

How it (git & github) works?

step 1. Initialize the git working directory (folder B)

→ `git init` ←

step 2: Add All the files into Staging Area

— `git add .` — `.` → represents all files.

step 3: Persist the changes made to file.
(save)

— `git commit -m "label."` — ←

step 4: Push all commits to centralized Repository (Github, GitLab, Azure Repo etc);

— `git push -u origin main` —
→ requires origin

↳ first you need to add
origin (Loc of github repo)

— `git remote add origin url`
